

## **Advantages and disadvantages of Multi-Inheritance in PHP**

**Name: Reth Hongti**

### ❖ Advantages

- Reusable when we need the property and method from many classes.
- Make easy for developer when we need to combine many attributes from many classes
- The parent class allow other class to extend it not specify for one task.
- It implements reusability of code.

### ❖ Disadvantages

- Slower than single inheritance
- It can have the attributes that we not use.
- Useless of memory when have the method and property that not use in the child class.
- It has a conflict when the parent class has method or property with the same name and child class doesn't know which one from which parents.
